**What are you going to research?**

Does me being in my room change the humidity of the room?

**What is your hypothesis?**

Me being in my room does change the humidity of the room, because humans lose moisture trough breathing and perspiration.

**How are you going to test this?**

I will measure the humidity of two days, one when I'm mostly in my room and one when I'm gone all day. Then I will compare the data, expecting the former to be higher.

**What is your experiment?**

I will use a Raspberry Pi and a Si7021 temperature and humidity sensor. I will take a measurement every minute for 18 hours a day, for two days, one when I'm mostly in my room and one when I'm gone all day. Then I will compare the data, expecting the former to be higher.

**What is your data?**

It will be two sets of humidity over time per minute.

**How are you going to obtain the data?**

I will use a Raspberry Pi and a Si7021 temperature and humidity sensor. I will take a measurement every minute for 18 hours a day, for two days.
